

LECTURE 1

3.1 Processes

Def A process is anything with 0 or more inputs and outputs.

Ex $f(x, y) = x^2 + y$

Def A process theory consists of:

- (i) a collection T of system-types
- (ii) a collection P of processes
- (iii) a means of composing diagrams of processes.

EXAMPLES

types: numbers
procs: matrices

- Functions $f: A \rightarrow B$ (types are sets A, B, C)
- relations $R \subseteq A \times B$ (types A, B, C, \dots sets)
- linear maps (types: vector sp., proc: ")
- classical (probabilistic) process
- quantum processes

LECTURE 2

The Golden Rule of Process Theories:

ONLY CONNECTIVITY MATTERS (ocm)

↑ diagram equation

Most p.t.'s have many more equations (process)

$$f(x,y) = x+y$$

"do nothing" / identity process

DIAGRAMMATIC REASONING := "using process equations to prove stuff"

Ex $\begin{array}{c} | \mathbb{R} \\ \boxed{-} \\ \cdot \mathbb{R} / \mathbb{R} \end{array} \because (m,n) \mapsto m-n$

$\begin{array}{c} | \mathbb{R} \\ \boxed{\cdot 2} \\ | \mathbb{R} \end{array} \because m \mapsto 2m$

$\begin{array}{c} | \mathbb{R} / \mathbb{R} \\ \boxed{cp} \\ | \mathbb{R} \end{array} \because n \mapsto (n,n)$

$(m, n) \mapsto m-n \mapsto (m-n, m-n)$

$(m, n) \mapsto (m, m, n, n) \mapsto (m-n, m-n)$

3.2 Circuit Diagrams

Parallel composition: $f \otimes g$ "f while g"

• associative $(f \otimes g) \otimes h = f \otimes (g \otimes h) = f \otimes (g \otimes k)$

• unit $f \otimes \square = f = \square \otimes f$

• The order matters. $f \otimes g = \begin{array}{|c} f \\ \hline g \end{array} \neq \begin{array}{|c} g \\ \hline f \end{array} =: \begin{array}{|c} g \\ \hline f \end{array}$

||

* We can also form joint systems.

B, C system-types $\Rightarrow B \otimes C$ is a system-type

* We write the trivial system as I . $A \otimes I = A = I \otimes A$

LECTURE 3

Sequential composition

$f \circ g :=$ "f after g"

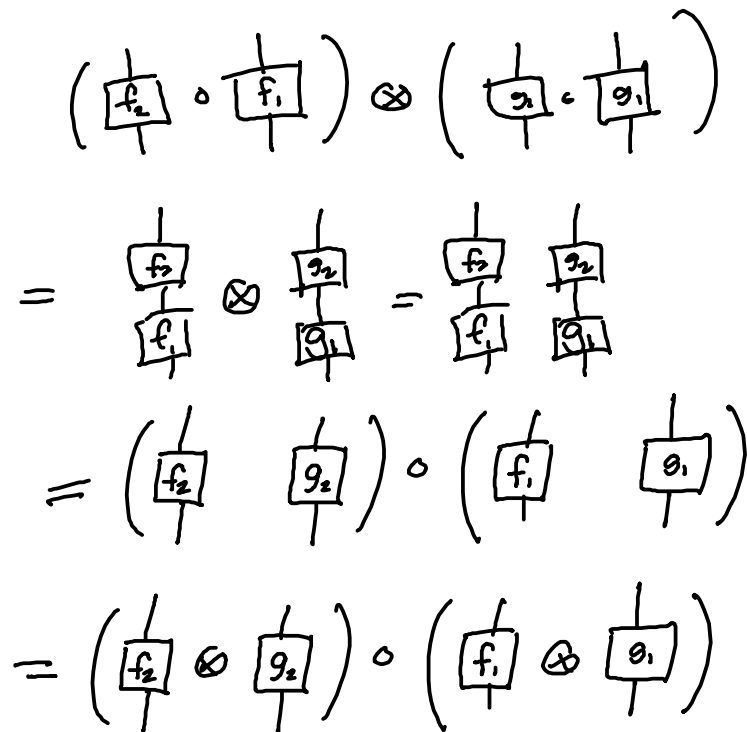

• associative

• has a unit: \downarrow_A ← "do nothing / identity" process

TOGETHER:

$$\left(\boxed{f_2} \circ \boxed{f_1} \right) \otimes \left(\boxed{g_2} \circ \boxed{g_1} \right) = \left(\boxed{f_2} \otimes \boxed{g_2} \right) \circ \left(\boxed{f_1} \otimes \boxed{g_1} \right)$$

"Interchange law"

DEF A circuit diagram is any diagram built from

- boxes \boxed{f} , \boxed{g} , ...
- (identity) wires $|_A$, $|_B$, ..., $|_I = \boxed{}$
- Swap processes $\begin{matrix} B & A \\ \frown & \smile \\ A & B \end{matrix}$

using only \otimes and \circ .

Equivalently circuit diagrams are any diagram that doesn't have feedback loops.

✓

✗

D.A.G.

3.3 Functions & relations as process theories.

functions

types: sets
procs: functions

$$f: A \rightarrow B$$

1-element set
 $I = \{*\}$

$$\circ := f \circ g \text{ composition: } (f \circ g)(x) = f(g(x))$$

$\otimes :=$ Cartesian product.

$$A \otimes I = A$$

$$A \times \{*\} = \{(a, *) \mid a \in A\} \cong \{a \mid a \in A\} = A$$

relations

types: sets
procs: relations

$$f \subseteq A \times B$$

e.g. $A = \{0, 1\}$ $B = \{2, 3, 4\}$

$$f = \{(0, 2), (0, 3), (1, 4)\} \subseteq A \times B$$

writes \downarrow $\{0 \mapsto 2, 0 \mapsto 3, 1 \mapsto 4\}$

= relation composition.

$$f = \begin{matrix} & \begin{matrix} 0 & 1 \end{matrix} \\ \begin{matrix} 2 \\ 3 \\ 4 \end{matrix} \\ \begin{pmatrix} 1 & 0 \\ 1 & 0 \\ 0 & 1 \end{pmatrix} \end{matrix}$$

$$g = \begin{matrix} & \begin{matrix} 2 & 3 & 4 \end{matrix} \\ \begin{matrix} x \\ y \end{matrix} \\ \begin{pmatrix} 1 & 0 & 1 \\ 0 & 0 & 1 \end{pmatrix} \end{matrix}$$

$$\begin{pmatrix} 1 & 0 & 1 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 1 & 0 \\ 0 & 1 \end{pmatrix} \stackrel{\text{OR } 1+1=1}{=} \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \begin{matrix} x \\ y \end{matrix}$$

⊗ also cartesian product!

$$f \otimes g \subseteq A \times B$$

$$f \otimes g :: (a, b) \mapsto (x, y) \quad \text{iff} \quad f :: a \mapsto x \quad \text{and} \quad g :: b \mapsto y$$

$$B = \{0, 1\} \quad B \times B = \{ \overset{00}{(0,0)}, \overset{01}{(0,1)}, \overset{10}{(1,0)}, \overset{11}{(1,1)} \}$$

* relations are simple, but still have "quantum-like" features.

3.4 Special processes

States $\begin{array}{c} |A \\ \nabla \\ \psi \end{array}$ $\psi: I \rightarrow A$ "preparation"

Effects $\begin{array}{c} \triangle \\ \pi \\ |A \end{array}$ $\pi: A \rightarrow I$ "testing for a property"

Generalised Born rule

test ξ $\begin{array}{c} \triangle \\ \pi \end{array}$
state ξ $\begin{array}{c} \nabla \\ \psi \end{array}$ \Rightarrow answer $\begin{array}{l} \rightarrow \text{yes or no} \\ \rightarrow \text{"possible" or "impossible"} \\ \rightarrow \text{probability.} \end{array}$
Depending on the thy

Numbers $\begin{array}{c} \diamond \\ \lambda \end{array}$ $\lambda: I \rightarrow I$

(most important numbers come from the Born rule)

Q how is $\begin{array}{c} \diamond \\ \lambda \end{array}$ like a number?

(partial) A 2 numbers can be "multiplied". $\lambda \cdot \mu := \begin{array}{c} \diamond \\ \lambda \end{array} \begin{array}{c} \diamond \\ \mu \end{array}$.

Q Why is "." like multiplication?

Assoc. $\lambda \cdot (\mu \cdot \xi) = \boxed{\lambda} \boxed{\mu} \boxed{\xi} = (\lambda \cdot \mu) \cdot \xi$

UNIT. $\lambda \cdot 1 = \lambda \cdot \boxed{\quad} = \boxed{\lambda} \boxed{\quad} = \lambda$

Comm. $\lambda \cdot \mu = \boxed{\lambda} \boxed{\mu} = \boxed{\mu} \boxed{\lambda} = \mu \cdot \lambda$

\Rightarrow "numbers" in a process they always form a commutative monoid.

Ex $\mathbb{R}, \mathbb{Q}, \mathbb{B}, [0,1],$ etc, etc.

In functions states are the same as elements of a set.

$$\begin{array}{c} |A \\ \downarrow \\ \psi \end{array} \quad \psi: \xi * \xi \rightarrow A \quad \psi(*) = a \in A.$$

... but effects + numbers are boring!

$$\begin{array}{c} \triangle \\ \pi \\ |A \end{array} = \begin{array}{c} \triangle \\ \pi \\ |A \end{array} \quad \pi: A \rightarrow \xi * \xi$$

... but in relations, they are interesting again!

LECTURE 4

In relations, states $\Psi: I \rightarrow A$ are relations $\Psi \subseteq \Sigma^+ \times A$
 $\cong A$

\Rightarrow states correspond to subsets.

$$\underbrace{\{a, c, d\}}_{\Psi} \subseteq A := \{a, b, c, d\}$$

$$\Psi ::= \begin{cases} * \mapsto a \\ * \mapsto c \\ * \mapsto d \end{cases} \quad \leftarrow \text{non-deterministic state.}$$

e.g. $A := B = \{0, 1\}$

4 possible states: $\downarrow_{\emptyset} = \{0\}$, $\downarrow_1 = \{1\}$, $\downarrow_B = \{0, 1\}$, $\downarrow_{\emptyset} = \emptyset$

Effects $\pi: A \rightarrow \Sigma^+$ $\pi \subseteq A \times \Sigma^+$

\Rightarrow effects are also subsets of A .

"questions about our state"

e.g. $A := B$

\uparrow_{\emptyset} "are you \emptyset ?"

\uparrow_1 "are you 1?"

\uparrow_B "true"

\uparrow_{\emptyset} "false"

$\lambda = \{ \}$ "0" impossible $\lambda: \Sigma^* \Sigma \rightarrow \Sigma^*$ "1" possible } possibilities.

Possibilities are a coarse-graining of probabilities.

"impossible" \leftrightarrow prob = 0

"possible" \leftrightarrow prob \neq 0

Zero processes

DEF A process thy has zero processes if it has a special process $\begin{array}{c} |B \\ \boxed{0} \\ |A \end{array}$ for every A, B that "eats everything."

Ex For relations, $\begin{array}{c} |B \\ \boxed{0} \\ |A \end{array} = \{\emptyset\}$.

Chapter 4: String diagrams

"separable vs. ^{non}separable"

4.1

DEF a \otimes -separable state $\Psi: I \rightarrow A \otimes B$ is a state s.t. there exist $\Psi_1: I \rightarrow A, \Psi_2: I \rightarrow B$ where:

$$\begin{array}{c} |A \quad |B \\ \hline \Psi \\ \hline \end{array} = \begin{array}{c} |A \\ \hline \Psi_1 \\ \hline \end{array} \quad \begin{array}{c} |B \\ \hline \Psi_2 \\ \hline \end{array}$$

In functions, states are elements. \Rightarrow all states are \otimes sep'l.

$$\begin{array}{c} |A \quad |B \\ \hline (a,b) \\ \hline \end{array} = \begin{array}{c} |A \\ \hline a \\ \hline \end{array} \quad \begin{array}{c} |B \\ \hline b \\ \hline \end{array}$$

in relations, separable states correspond to Cartesian products of subsets.

e.g. if $\begin{array}{c} |B \quad |B \\ \hline S \\ \hline \end{array} = \begin{array}{c} |B \\ \hline t_1 \\ \hline \end{array} \quad \begin{array}{c} |B \\ \hline t_2 \\ \hline \end{array}$ for $t_1 = \{0\} \subseteq B, t_2 = \{0,1\} \subseteq B$

then $S = t_1 \times t_2 = \{(0,0), (0,1)\} \subseteq B \times B$.

But! NO ALL SUBSETS $S \subseteq B \times B$ are cart. pr's

of subsets $t_1 \subseteq B, t_2 \subseteq B$.

⇒ relations has non-separable states.

Ex $\begin{array}{c} |B| \\ |B| \\ \hline \triangle \\ R \end{array} \equiv \begin{cases} * \mapsto (0,0) \\ * \mapsto (1,1) \end{cases}$ is not separable.

(if R was sep'l, $(0,0) \in R, (1,1) \in R \Rightarrow (0,1) \in R$ and $(1,0) \in R$)

DEF a 0-separable process $f: A \rightarrow B$ is a proc. such that there exists a state $\psi: I \rightarrow B$ and an effect $\pi: A \rightarrow I$ such that

$$\begin{array}{c} |B \\ \hline \square \\ f \\ \hline |A \end{array} = \begin{array}{c} |B \\ \hline \triangle \\ \psi \\ \hline \triangle \\ \pi \\ \hline |A \end{array}$$

(DEF Trivial process thy is a process thy where all processes 0-separate. ← "nothing ever happens")

In relations (and in Q.T.) there are the same

amount of processes $f: A \rightarrow B$ as there are states $\psi: I \rightarrow A \otimes B$
 $f \subseteq A \times B$ $\psi \subseteq \Sigma \times \Sigma \times A \times B$

PROCESS-STATE DUALITY

(in Q.T. Choi-Jamioitkowski isomorphism)

DEF A process theory admits string diagrams if it has a special state + effect for every A , satisfying:

Thm PS + SP are inverses.

DEF A string diagram is a circuit diagram + caps + cups.

OR equivalently it is a diagram which allows us to

connect any input or output to any input or output.

$$U := \begin{array}{c} \perp \\ \cup \end{array} \quad \cap := \begin{array}{c} \triangle \\ \perp \end{array} .$$

Thm NO-GO FOR UNIVERSAL SEPARABILITY.

IF A P.T. ADMITS STRING DIAGRAMS

& ALL STATES \otimes -SEPARATE

THEN THE P.T. IS TRIVIAL.

Pf Assume $U = \downarrow \downarrow$, then for any $f: A \rightarrow B$:

⇒ all f o-separate, thus the p.t. is trivial. \square

⇒ functions does not admit string diagrams.

(but relations does!)

LECTURE 5

In relations,

$$\bigcup^A := \{ * \mapsto (a, a) \mid a \in A \}$$

$$\{ (a, a) \mid a \in A \} \subseteq \underline{A \otimes A} := \{ (a, b) \mid a, b \in A \}$$

$$\begin{array}{c} \curvearrowright \\ \uparrow \quad \uparrow \\ A \quad A \end{array} := \{ (a, a) \mapsto * \mid a \in A \}$$

$$\begin{array}{c} \curvearrowright \\ \downarrow \quad \downarrow \\ A \quad A \end{array} = 1$$

$$\begin{array}{c} \curvearrowright \\ \downarrow \quad \downarrow \\ A \quad A \end{array} = 0 \quad b \neq a$$

4.2 Transposition & trace of a process

$$f: A \rightarrow B \quad \begin{array}{c} |B \\ \square \\ f \\ |A \end{array} \rightsquigarrow \begin{array}{c} |B \\ \square \\ f \\ |A \end{array}$$

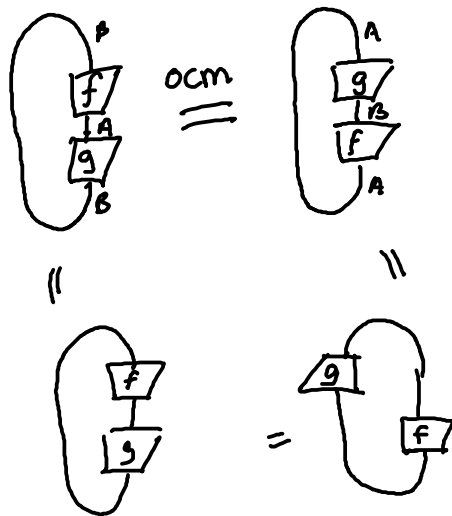

DEF (Transpose) $\left(\begin{array}{c} |B \\ \square \\ f \\ |A \end{array} \right)^T = \begin{array}{c} |A \\ \square \\ f \\ |B \end{array} := \begin{array}{c} A \\ \curvearrowright \\ \square \\ f \\ \downarrow \\ B \end{array} \leftarrow f^T: B \rightarrow A$

$$\begin{array}{c} \curvearrowright \\ \downarrow \\ B \end{array} \begin{array}{c} \square \\ f \\ |A \end{array} = \begin{array}{c} \curvearrowright \\ \downarrow \\ B \end{array} \begin{array}{c} \square \\ f \\ |A \end{array} = \begin{array}{c} \square \\ f \\ |A \end{array} \begin{array}{c} \downarrow \\ B \end{array}$$

DEF (TRACE) $\text{tr} \left(\begin{array}{c|c} A \\ \hline F \\ \hline A \end{array} \right) := \text{string diagram}$ $\bigcirc_A \equiv \text{dim}(A)$

CYCCLICITY

$$\text{tr}(f \circ g) = \text{tr}(g \circ f)$$

4.3.1 ADJOINTS.

EXTENDS TO PROCESSES: $\begin{array}{c|c} B \\ \hline f \\ \hline A \end{array} \mapsto \begin{array}{c|c} A \\ \hline f \\ \hline B \end{array} =: f^\dagger: B \rightarrow A$

DEF an adjoint is a mapping $\begin{array}{|c|} \hline B \\ \hline \square \\ \hline A \end{array} \xrightarrow{f} \begin{array}{|c|} \hline A \\ \hline \square \\ \hline B \end{array}$ that is:

* involutive $(f^\dagger)^\dagger = f$

* reflects diagrams $\left(\begin{array}{|c|} \hline \square \\ \hline h \\ \hline \end{array} \right)^\dagger = \begin{array}{|c|} \hline h \\ \hline \square \\ \hline \end{array} \quad (U)^\dagger = \cap$
 $(\cap)^\dagger = U$

* definite $\begin{array}{|c|} \hline \psi \\ \hline A \\ \hline \psi \\ \hline \end{array} = \emptyset \iff \begin{array}{|c|} \hline A \\ \hline \psi \\ \hline \end{array} = \emptyset$

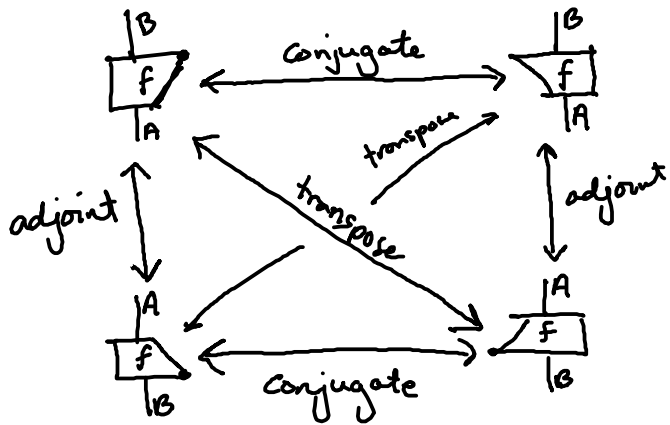

$\bar{f}: A \rightarrow B$

ii

$$\left(\left(\begin{array}{|c|} \hline \square \\ \hline f \\ \hline \end{array} \right)^\top \right)^\dagger = \left(\begin{array}{|c|} \hline \square \\ \hline f \\ \hline \end{array} \right)^\dagger = \begin{array}{|c|} \hline \square \\ \hline f \\ \hline \end{array}$$

// com

$$\left(\left(\begin{array}{|c|} \hline \square \\ \hline f \\ \hline \end{array} \right)^\dagger \right)^\top = \left(\begin{array}{|c|} \hline \square \\ \hline f \\ \hline \end{array} \right)^\top = \begin{array}{|c|} \hline \square \\ \hline f \\ \hline \end{array}$$

DEF For 2 states $\begin{array}{|c|} \hline A \\ \hline \psi \\ \hline \end{array}$, $\begin{array}{|c|} \hline A \\ \hline \phi \\ \hline \end{array}$, the inner product is a number:

$$\langle \phi | \psi \rangle := \begin{array}{|c|} \hline \phi \\ \hline A \\ \hline \psi \\ \hline \end{array}$$

physics convention.

and a state is normalised if $\langle \psi | \psi \rangle = 1$. i.e. $\begin{array}{|c|} \hline \psi \\ \hline \psi \\ \hline \end{array} = \square$

Prop The inner product \mathcal{K} :

1. conjugate-symmetric $\overline{\langle \phi | \psi \rangle} = \langle \psi | \phi \rangle$
2. preserves numbers (2nd arg.) $\begin{array}{c} |A \\ \psi \\ \hline \end{array} \quad \lambda \cdot \psi := \begin{array}{c} |A \\ \lambda \\ \hline \end{array} \begin{array}{c} \psi \\ \hline \end{array}$
 $\Rightarrow \langle \phi | \lambda \cdot \psi \rangle = \lambda \cdot \langle \phi | \psi \rangle$
3. conjugates numbers (1st arg.) $\langle \lambda \cdot \phi | \psi \rangle = \bar{\lambda} \cdot \langle \phi | \psi \rangle$
4. is positive definite.

DEF a process $f: A \rightarrow A$ is positive if $\exists g: A \rightarrow B$ st.

$$f = \begin{array}{c} |A \\ \boxed{f} \\ |A \end{array} = \begin{array}{c} |A \\ \boxed{g} \\ |B \\ \boxed{g^\dagger} \\ |A \end{array} = g^\dagger \circ g$$

Ex Positive number. $\begin{array}{c} | \\ \boxed{1} \\ | \end{array}$ s.t. $\exists \begin{array}{c} |A \\ \psi \\ \hline \end{array}$ s.t. $\lambda = \begin{array}{c} \psi \\ |A \\ \hline \psi \\ \hline \end{array}$.

$$\lambda \text{ s.t. } \exists u: I \rightarrow I. \quad \begin{array}{c} | \\ \boxed{1} \\ | \end{array} = \begin{array}{c} \boxed{u} \\ \vdots \\ \boxed{u} \end{array} \quad \lambda = \bar{u} u$$

LECTURE 6

DEF An isometry $\begin{array}{c} |B \\ \boxed{u} \\ |A \end{array}$ is a proc. satisfying:

$$\begin{array}{c} |A \\ \boxed{u} \\ |B \\ \boxed{u} \\ |A \end{array} = |A$$

Prop Isometries preserve inner products: $\langle \phi | \psi \rangle = \langle U\phi | U\psi \rangle$

n.b. $\langle \phi | \psi \rangle := \left(\begin{array}{|c} \phi \\ \hline \psi \end{array} \right)^\dagger \circ \begin{array}{|c} \psi \\ \hline \phi \end{array}$

PF $\left(\begin{array}{|c} \psi \\ \hline \phi \end{array} \right)^\dagger \circ \left(\begin{array}{|c} \psi \\ \hline \phi \end{array} \right) = \left(\begin{array}{|c} \phi \\ \hline \psi \end{array} \right) \circ \left(\begin{array}{|c} \psi \\ \hline \phi \end{array} \right) = \begin{array}{|c} \phi \\ \hline U \\ \hline U \\ \hline \psi \end{array} = \begin{array}{|c} \phi \\ \hline \psi \end{array} \quad \square$

DEF A unitary $\begin{array}{|c} B \\ \hline U \\ \hline A \end{array}$ is a process that satis:

$$\begin{array}{|c} A \\ \hline U \\ \hline B \\ \hline U \\ \hline A \end{array} = \left| \begin{array}{c} \\ \\ \\ A \end{array} \right. \quad \begin{array}{|c} B \\ \hline U \\ \hline A \\ \hline U \\ \hline B \end{array} = \left| \begin{array}{c} \\ \\ \\ B \end{array} \right.$$

DEF A process $\begin{array}{|c} A \\ \hline P \\ \hline A \end{array}$ is called self-adjoint if $\begin{array}{|c} A \\ \hline P \\ \hline A \end{array} = \begin{array}{|c} A \\ \hline P \\ \hline A \end{array}$.

Prop Positive processes are self-adjoint.

PF $\begin{array}{|c} P \\ \hline \end{array}$ is +ive, there exists $\begin{array}{|c} g \\ \hline \end{array}$ s.t. $\begin{array}{|c} P \\ \hline \end{array} = \begin{array}{|c} g \\ \hline g \\ \hline \end{array}$.

But $\left(\begin{array}{|c} g \\ \hline g \\ \hline \end{array} \right)^\dagger = \begin{array}{|c} g \\ \hline g \\ \hline \end{array}$

$$(g^\dagger \circ g)^\dagger = g^\dagger \circ g^{\dagger\dagger} = g^\dagger \circ g. \quad \square$$

DEF A process $\begin{array}{|c} P \\ \hline \end{array}$ is a projector if it is s.a. + $\begin{array}{|c} P \\ \hline P \\ \hline \end{array} = \begin{array}{|c} P \\ \hline \end{array}$. idempotent

PROP Projectors are positive.

Pf $\begin{array}{|c|} \hline P \\ \hline \end{array} = \begin{array}{|c|} \hline P \\ \hline \end{array} = \begin{array}{|c|} \hline P \\ \hline \end{array}$. Thus P is +ive (where $g_i = P$) \square

"Quantum-like features from string diagrams."

NO-CLONING \rightarrow quantum data cannot be copied
 \downarrow
 states

In quantum theory, there exists no process $\Delta: A \rightarrow A \otimes A$ where:

(a) $\forall \begin{array}{|c|} \hline A \\ \hline \end{array} \cdot \begin{array}{|c|} \hline \Delta \\ \hline \end{array} = \begin{array}{|c|} \hline A \\ \hline \end{array} \begin{array}{|c|} \hline A \\ \hline \end{array}$

(b) $\forall \psi: I \rightarrow A$. $\begin{array}{|c|} \hline B \\ \hline \end{array} \begin{array}{|c|} \hline F \\ \hline \end{array} = \begin{array}{|c|} \hline B \\ \hline \end{array} \begin{array}{|c|} \hline G \\ \hline \end{array} \Rightarrow f = g$
 "enough states"
 (c) $\forall \psi, \phi$ $\begin{array}{|c|} \hline I \\ \hline \end{array} \begin{array}{|c|} \hline F \\ \hline \end{array} = \begin{array}{|c|} \hline I \\ \hline \end{array} \begin{array}{|c|} \hline G \\ \hline \end{array} \Rightarrow f = g$

2 PROOFS (MAKING DIFFERENT ASSUMPTIONS)

"CLASSIC" PROOF

WOOTERS + ZUREK: 1982

* $\lambda \neq 0, \lambda \cdot \begin{array}{|c|} \hline F \\ \hline \end{array} = \lambda \cdot \begin{array}{|c|} \hline G \\ \hline \end{array} \Rightarrow f = g$

* Δ is an isometry

* $\langle \psi | \phi \rangle = 1 \Rightarrow \begin{array}{|c|} \hline \psi \\ \hline \end{array} = \begin{array}{|c|} \hline \phi \\ \hline \end{array}$

normalised ψ, ϕ

"CAPS + CUPS" PROOF

ABRAMSKY 2010

(1) $\exists \begin{array}{|c|} \hline A \\ \hline \end{array} \cdot \begin{array}{|c|} \hline \psi \\ \hline \end{array} = 1$

(2) $\begin{array}{|c|} \hline \Delta \\ \hline \end{array} = \begin{array}{|c|} \hline \Delta \\ \hline \end{array}$

(3) $\begin{array}{|c|} \hline \Delta \\ \hline \end{array} \begin{array}{|c|} \hline \Delta \\ \hline \end{array} = \begin{array}{|c|} \hline \psi \\ \hline \end{array} \begin{array}{|c|} \hline \psi \\ \hline \end{array}$

Thm If a process theory admits string diagrams, and all types A have a process satisfying (1), (2), + (3), then the process theory is trivial.

Pf

Let $\begin{array}{c} \triangle^A \\ \psi \\ \triangle^A \end{array} = \cup^A$. Then —

$$\begin{array}{c} \text{---} \\ \diagup \quad \diagdown \\ \triangle^A \quad \triangle^A \\ \diagdown \quad \diagup \\ \text{---} \end{array} = \cup \cup$$

\equiv

$$\begin{array}{c} \text{---} \\ \diagup \quad \diagdown \\ \triangle^A \quad \triangle^A \\ \diagdown \quad \diagup \\ \text{---} \end{array} \stackrel{\text{axm}}{=} \begin{array}{c} \text{---} \\ \diagup \quad \diagdown \\ \triangle^A \quad \triangle^A \\ \diagdown \quad \diagup \\ \text{---} \end{array} = \begin{array}{c} \text{---} \\ \diagup \quad \diagdown \\ \cup \\ \diagdown \quad \diagup \\ \text{---} \end{array} \stackrel{\text{def}}{=} \cup$$

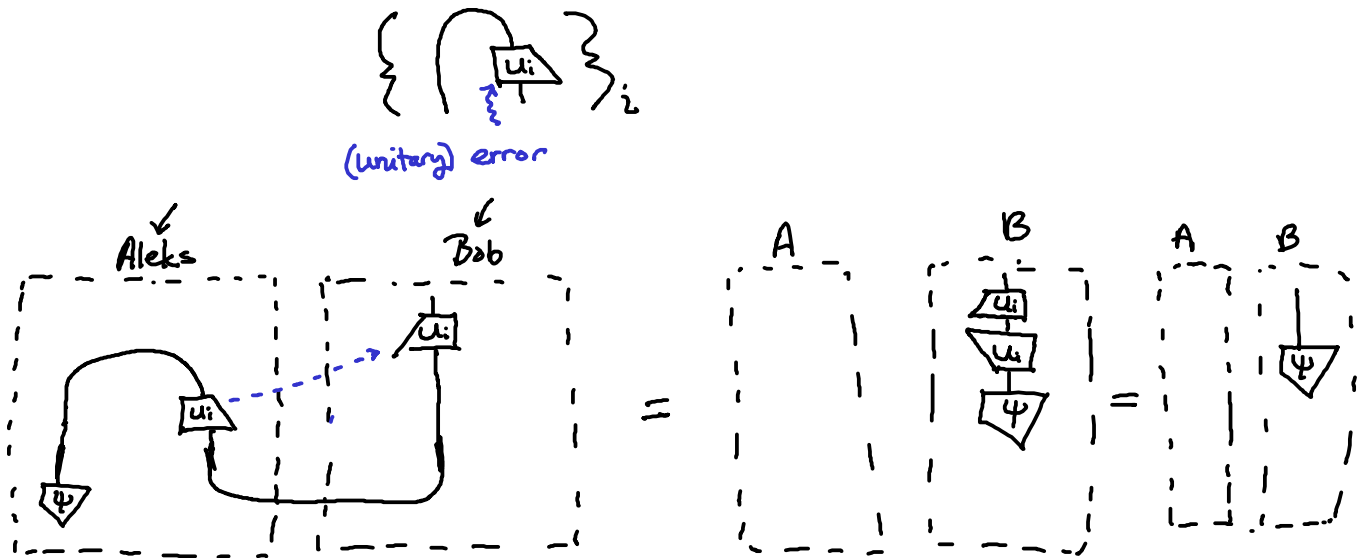

$$\cup \cup = \cup \Rightarrow \cap = | \Rightarrow \begin{array}{c} \triangle^A \\ \cup \\ \triangle^A \end{array} = \begin{array}{c} \triangle^A \\ \psi \\ \triangle^A \end{array} \Big| \Rightarrow \begin{array}{c} \triangle^A \\ \psi \\ \triangle^A \end{array} \Big| = |$$

\Rightarrow Any process is 0-separable. (ie. P.T. is trivial). \square

TELEPORTATION

But I am allowed a non-deterministic process:

In relations:
